2. Scenario: You are a data analyst working for a company that sells products online. You have been tasked with analyzing the sales data for the past month. The data is stored in a NumPy array.Question: How would you find the average price of all the products sold in the past month?

Assume 3x3 matrix with each row representing the sales for a different product

Code:

```
import numpy as np

# 3x3 matrix: each row = sales (prices) for a different product

sales = np.array([

    [250, 300, 275],

    [120, 130, 125],

    [500, 450, 480]

])

# Average price of all products sold (all elements)

overall_avg = np.mean(sales)

print("Overall average price:", overall_avg)

# Optional: average per product (row-wise)

per_product_avg = np.mean(sales, axis=1)

print("Average per product:", per_product_avg)
```

input: ([

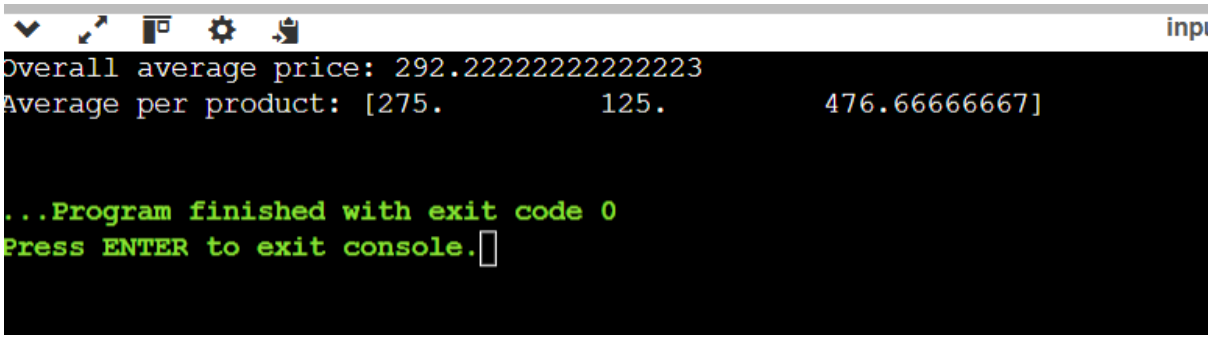
```
    [250, 300, 275],

    [120, 130, 125],

    [500, 450, 480]

]
```

Output:



inpu
Overall average price: 292.22222222222223
Average per product: [275. 125. 476.66666667]
